

# Roller-Tilt® CONSTANT FORCE SYSTEM

Roller-Tilt® is a superior constant force balance for residential, tilt-window applications. It is the only constant force balance where the springs follow the sash. This exclusive, patented design allows the sash to move with significantly less friction and noise. This also allows Roller-Tilt® to more easily satisfy egress requirements, because the balance does not interfere with tilt locks. Roller-Tilt® remains hidden during operation, has an optional set screw to adjust friction and, of course, performs reliably. It is rated Class 2 on the American Architectural Manufacturers Association (AAMA) Verified Components List.
